

CS411 Team Assignment 1 - Proposal

Erika, Tim, Ziyang, Veena

Proposal 1. Restaurant Reviews

Ever wonder which restaurants your network of friends love? Ever feel uncomfortable posting on Yelp or other public websites? Well, this web application will allow you to rate restaurants, post photos, and write reviews that will only be visible within your network. The best part is it will incorporate data from public sites like Yelp and Zagat! The web app will require a login and will use the Yelp API. It will find the best restaurants in your area based the network you choose.

Open Street maps - API for maps

Proposal 2. Digital Mixtape DigiTape

The music sharing world has transformed into an amazing space of discovery. Do you miss anything though? Think about it, as we moved towards the digital music industry we lost one of the most intimate forms of sharing music, that is Mixtapes or Mix CD's etc. Remember how excited you would be when someone made you a personal playlist? This is what DigiTape brings back. A user can make a playlist and then send it as a gift to a friend. The user would purchase all the songs for the friend so that the friend could download the playlist and listen on or off wifi. It would be the new mixtape, called DigiTape.
